(54) Title: FORMULATIONS FOR PHARMACEUTICAL AGENTS IONIZABLE AS FREE ACIDS OR FREE BASES

(57) Abstract: The present invention features formulations of indolinones which compounds are ionizable as free acids or free bases. The formulation is suitable for parenteral or oral administration, wherein the formulation comprises an ionizable substituted indolinone, and a pharmaceutically acceptable carrier therefor. The term "ionizable substituted indolinone" includes pyrrole substituted 2-indolinones which, in addition to being otherwise optionally substituted on both the pyrrole and 2-indolinone portions of the compound, are necessarily substituted on the pyrrole moiety with one or more hydrocarbon chains which themselves are substituted with at least one polar group. The formulations and the compounds themselves are useful for the treatment of protein kinase related disorders as discussed herein.

WO 01/37820 A2

**FORMULATIONS FOR PHARMACEUTICAL AGENTS IONIZABLE
AS FREE ACIDS OR FREE BASES**

5 The present application claims priority to U.S. App. Ser. No. 60/167,544,
filed November 24, 1999, which is hereby incorporated by reference.

FIELD OF THE INVENTION

The instant invention provides formulations for compounds, such as pyrrole substituted 2-indolinones, which compounds are ionizable as free acids or free bases. Also provided are methods of making and using the formulations of the invention.

10 **BACKGROUND OF THE INVENTION**

The following description of the background of the invention is provided to aid in understanding the invention, but is not admitted to describe or constitute prior art to the invention. Various methods are available for administering therapeutic agents to a patient. Such methods include parenteral, oral, ocular, nasal, topical, and
15 transmucosal administration. Variations of these different types of administrations exist. For example, parenteral administration includes intravenous, subcutaneous, intraperitoneal, intramuscular, intraosseous, and intramedullary injection. The chosen mode of administration should take into account the nature of the therapeutic compound and the illness being treated.

20 Certain potential pharmaceuticals are hydrophobic and typically have very low aqueous solubility and hence low oral bioavailability. Different techniques concerned with solubilizing hydrophobic compounds include those described by Praveen *et al.*, U.S. Patent No. 5,314,685, and Fernandes *et al.*, U.S. Patent No. 4,992,271, both of which are hereby incorporated by reference herein in their
25 entirety, including any figures, tables, and drawings.

One measure of the potential usefulness of an oral formulation of a new pharmaceutical agent is the bioavailability observed after oral administration of the formulation. Various factors can affect the oral bioavailability of the drug. These factors include aqueous solubility, drug absorption throughout the gastrointestinal

tract, drug stability in gastrointestinal tract, and first pass effect. Aqueous solubility is one of the most important factors. The oral bioavailability of an aqueous solution formulation of a drug is generally used as the standard or the ideal bioavailability against which other oral formulations are measured. Formulations of drugs that
5 increase the relative bioavailability of the drug as compared to an aqueous solution are desirable, especially with hydrophobic compounds.

SUMMARY OF THE INVENTION

The instant invention features formulations for compounds, such as indolinones, which compounds are ionizable as free acids or free bases.

10 In one aspect, the invention features a formulation suitable for parenteral or oral administration, said formulation comprising an ionizable substituted indolinone, and a pharmaceutically acceptable carrier therefor.

The term "ionizable substituted indolinone" as used herein includes pyrrole substituted 2-indolinones which, in addition to being otherwise optionally
15 substituted on both the pyrrole and 2-indolinone portions of the compound, are necessarily substituted on the pyrrole moiety with one or more hydrocarbon chains which themselves are substituted with at least one polar group. Physiologically acceptable salts and prodrugs of the claimed compounds are also within the scope of this invention.

20 A "hydrocarbon chain" refers to an alkyl, alkenyl or alkynyl group, as defined herein.

A "polar" group refers to a group wherein the nuclei of the atoms covalently bound to each other to form the group do not share the electrons of the covalent bond(s) joining them equally; that is the electron cloud is denser about one atom
25 than another. This results in one end of the covalent bond(s) being relatively negative and the other end relatively positive; i.e., there is a negative pole and a positive pole. Examples of polar groups include, without limitation, hydroxy, alkoxy, carboxy, nitro, cyano, amino (primary, secondary and tertiary), ammonium, amido, ureido, sulfonamido, sulfinyl, sulfhydryl, silyl, S-sulfonamido, N-

sulfonamido, C-carboxy, O-carboxy, C-amido, N-amido, sulfonyl, phosphono, morpholino, piperaziny, tetrazolo, and the like.

While not being bound to any particular theory, applicants at this time believe that the polar groups may interact electronically, for example, but without
 5 limitation, through hydrogen bonds, Van der Waals forces and/or ionic bonds (but not covalent bonding), with the amino acids at a protein tyrosine kinase (PTK) active site. The PTK active site is involved with ligand binding (or similar interaction) that contributes to cellular response. These interactions may assist the molecules of this invention to bind to an active site with sufficient tenacity to
 10 interfere with or prevent the natural substrate from entering the site. Polar groups may also contribute to the selectivity of the compounds; i.e., one polar group may have greater affinity for a PTK binding domain than other polar groups so that the compound containing the first particular polar group is more potent than the compounds containing the other polar groups.

15 Thus, the "pyrrole substituted 2-indolinones" contemplated for use in the present invention include compounds having the following chemical structure:

25 A method for the synthesis of a 3-pyrrolidinyl-2-indolinone of formula 1 suitable for use as a "pyrrole substituted 2-indolinones" in this invention comprises reacting an oxindole of formula 2 with an aldehyde of formula 3 in a solvent, preferably in the presence of a base.

30 The reaction may be carried out in the presence of a base. The base may be an organic or an inorganic base. If an organic base is used, preferably it is a nitrogen base. Examples of organic nitrogen bases include, but are not limited to,

diisopropylamine, trimethylamine, triethylamine, aniline, pyridine, 1,8-diazabicyclo[5.4.1]undec-7-ene, pyrrolidine and piperidine.

5 Examples of inorganic bases are, without limitation, ammonia, alkali metal or alkaline earth hydroxides, phosphates, carbonates, bicarbonates, bisulfates and amides. The alkali metals include, lithium, sodium and potassium while the alkaline earths include calcium, magnesium and barium.

In a presently preferred aspect of this method, when the solvent is a protic solvent, such as water or alcohol, the base is an alkali metal or an alkaline earth inorganic base, preferably, a alkali metal or an alkaline earth hydroxide.

10 It will be clear to those skilled in the art, based both on known general principles of organic synthesis and on the disclosures herein which base would be most appropriate for the reaction contemplated.

The solvent in which the reaction is carried out may be a protic or an aprotic solvent, preferably it is a protic solvent. A "protic solvent" is a solvent which has 15 hydrogen atom(s) covalently bonded to oxygen or nitrogen atoms which renders the hydrogen atoms appreciably acidic and thus capable of being "shared" with a solute through hydrogen bonding. Examples of protic solvents include, without limitation, water and alcohols.

An "aprotic solvent" may be polar or non-polar but, in either case, does not 20 contain acidic hydrogens and therefore is not capable of hydrogen bonding with solutes. Examples, without limitation, of non-polar aprotic solvents, are pentane, hexane, benzene, toluene, methylene chloride and carbon tetrachloride. Examples of polar aprotic solvents are chloroform, tetrahydro- furan, dimethylsulfoxide and dimethylformamide.

25 In a presently preferred aspect of this method, the solvent is a protic solvent, preferably water or an alcohol such as ethanol.

The reaction is carried out at temperatures greater than room temperature. The temperature is generally from about 30° C to about 150° C, preferably about 80°C to about 100° C, most preferable about 75° C to about 85° C, which is about 30 the boiling point of ethanol. By "about" is meant that the temperature range is preferably within 10° C of the indicated temperature, more preferably within 5° C of

the indicated temperature and, most preferably, within 2° C of the indicated temperature. Thus, for example, by "about 75° C" is meant 75° C \pm 10° C, preferably 75° C \pm 5° C and most preferably, 75° C \pm 2° C.

Also included within the ionizable substituted indolinones contemplated for use in the present invention are pharmaceutically acceptable salts, prodrugs, derivatives, and analogs of the above-identified pyrrole substituted 2-indolinones.

As utilized herein, the term "pharmaceutically acceptable salt" includes
5 formulations of a compound that do not abrogate the biological activity and properties of the compound. Pharmaceutically acceptable salts can be obtained by reacting a pyrrole substituted 2-indolinone contemplated for use in the invention with inorganic or organic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, methanesulfonic acid, ethanesulfonic acid, p-
10 toluenesulfonic acid, salicylic acid and the like, or with inorganic or organic bases such as sodium hydroxide, potassium hydroxide, ammonium hydroxide, calcium hydroxide, choline, n-methyl glucamine, diethylamine, procaine and the like. The pharmaceutically acceptable salts which the compounds of this invention may form include the negatively or the positively charged species. Examples of salts in which
15 the compound forms the positively charged moiety include, without limitation, quaternary ammonium (defined elsewhere herein), salts such as the hydrochloride, sulfate, carbonate, lactate, tartrate, maleate, succinate wherein the nitrogen atom of the quaternary ammonium group is a nitrogen of the selected compound of this invention which has reacted with the appropriate acid. Salts in which a compound of
20 this invention forms the negatively charged species include, without limitation, the sodium, potassium, calcium and magnesium salts formed by the reaction of a carboxylic acid group in the compound with an appropriate base (e.g. sodium hydroxide (NaOH), potassium hydroxide (KOH), calcium hydroxide (Ca(OH)₂), etc.). As utilized herein, "quaternary ammonium" includes a quaternized nitrogen
25 (e.g., -NRR'R'', where each of R, R' and R'' is independently selected from H, aryl, alkyl, and the like), a quaternized nitrogen containing heterocyclic aryl, and the like.

As utilized herein, the term "prodrug" includes any compounds that, when administered to a biological system, are converted into the active ionizable substituted indolinone contemplated for use in the invention either as a result of
30 spontaneous chemical reaction(s), enzyme catalyzed reaction(s), metabolic reaction(s), or the like. A "prodrug" also refers to an agent which is converted into

the parent drug in vivo. Prodrugs are often useful because, in some situations, they may be easier to administer than the parent drug. They may, for instance, be bioavailable by oral administration whereas the parent drug is not. The prodrug may also have improved solubility in pharmaceutical compositions over the parent drug.

- 5 An example, without limitation, of a prodrug would be a compound of the present invention which is administered as an ester (the "prodrug") to facilitate transmittal across a cell membrane where water solubility is detrimental to mobility but which then is metabolically hydrolyzed to the carboxylic acid, the active entity, once inside the cell where water solubility is beneficial. A further example of a prodrug might be
- 10 a short polypeptide bonded to a carboxy group wherein metabolic removal of the polypeptide group releases the active compound.

In one aspect of the invention formulation, a therapeutically effective amount of the ionizable substituted indolinone is utilized in the invention formulation.

- As used herein, a "pharmaceutically acceptable carrier" refers to a carrier or
- 15 diluent that does not abrogate the biological activity and/or properties of the administered compound while facilitating administration by, for example, stabilizing or solubilizing the compound. Suitable pharmaceutically acceptable carriers include, without limitation, one or more polyoxyhydrocarbyl compounds, one or more buffers, one or more pharmaceutically acceptable surfactants, one or more
- 20 pharmaceutically acceptable preservatives, one or more antioxidants, one or more pharmaceutically acceptable alcohols, one or more pharmaceutically acceptable aqueous solutions, one or more pharmaceutically acceptable oils, liposomes, one or more polyglycolized lipids, one or more pharmaceutically acceptable granulating agents, one or more pharmaceutically acceptable diluents, one or more
- 25 pharmaceutically acceptable binders, one or more pharmaceutically acceptable disintegrants, one or more pharmaceutically acceptable lubricants, one or more pharmaceutically acceptable flow enhancers, one or more pharmaceutically acceptable suspending agents, and suitable combinations of any two or more thereof.

- The term "pharmaceutically acceptable" or "pharmaceutical" as used herein
- 30 refers to solutions or components of the formulation that do not prevent the therapeutic compound from exerting a therapeutic effect and do not cause

unacceptable adverse side effects. Examples of pharmaceutically acceptable reagents are provided in *The United States Pharmacopeia The National Formulary*, United States Pharmacopeial Convention, Inc., Rockville, MD 1990 and *FDA Inactive Ingredient Guide* 1990, 1996 issued by the Division of Drug Information Resources
5 (both are hereby incorporated by reference herein, including any drawings).
Unacceptable side effects vary for different diseases. Generally, the more severe the disease the more toxic effects which will be tolerated. Unacceptable side effects for different diseases are known in the art.

Although all permutations of specific components within the invention
10 formulations are contemplated to be within the scope of the present invention, the following combinations of one or more specific pharmaceutically acceptable carrier(s) and specific ionizable substituted indolinones are preferred in one aspect of the invention.

In one aspect of the invention formulation, the formulation is suitable for
15 parenteral administration. A preferred embodiment of this aspect has the ionizable substituted indolinone be a pyrrole substituted 2-indolinone of Formula I having R^9 be $-(alk_1)Z_1$, and each of R^8 and R^{10} independently selected from the group consisting of hydrogen and unsubstituted lower alkyl. In a presently preferred aspect, the ionizable substituted indolinone is 3-[2,4-dimethyl-5-(2-oxo-1,2-dihydro-
20 indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid (compound IV), and pharmaceutically active salts, prodrugs, derivatives, and analogs thereof.

In another aspect of the invention formulation suitable for parenteral or oral administration, the pharmaceutically acceptable carrier comprises one or more polyoxyhydrocarbyl compounds. A preferred embodiment of this aspect has the
25 ionizable substituted indolinone be a pyrrole substituted 2-indolinone of Formula I having R^9 be $-(alk_1)Z_1$, and each of R^8 and R^{10} independently selected from the group consisting of hydrogen and unsubstituted lower alkyl. In a presently preferred aspect, the ionizable substituted indolinone is 3-[2,4-dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid (compound IV),
30 and pharmaceutically active salts, prodrugs, derivatives, and analogs thereof.

In another aspect of the invention, the formulation includes permeability and penetrating enhancers. These include ionic compounds (e.g., 3,5-diidosalicylate sodium) dimethylsulfoxide and related compounds (e.g., decylmethyl sulfoxide) azone, and related compounds (e.g., N-alkyl-dihydro-1,4-oxazepine-5,7-diones),
5 solvents, and related compounds (e.g., ethanol, dimethyl acetamide, dimethylformamide) fatty alcohols, fatty acids and enzymes (e.g., acid phosphatase and papin). These are other examples of permeability and penetration enhancers can be found in Pharmaceutical Skin Penetration Enhancement, K.A. Walters and J. Hadgraft, Eds. (Dekker, New York, 1993).

10 The term "polyoxyhydrocarbyl compound" as used herein includes without limitation water soluble carbohydrates (such as glucose, sucrose, maltotriose, and the like); water soluble carbohydrate derivatives (such as gluconic acid and mannitol and oligosaccharides, and the like); water soluble polypeptides; water soluble
15 polymers (such as polyvinylpyrrolidone, poly(vinyl alcohol), and in particular, polyethers such as other polyoxyalkylenes including poly(ethylene glycol) and the like); water soluble mixed oxyalkylene polymers; and the polymeric forms of ethylene glycol; and the like; and suitable combinations of two or more thereof. Although polyoxyhydrocarbyl compounds preferably contain more than one carbon, oxygen, and hydrogen atom, some molecules such as poly(ethyleneimine) are also
20 included.

A particularly preferred class of solubilizing polyoxyhydrocarbyl compounds comprises poly(ethylene glycol) (PEG) and PEG derivatives, such as PEG monomethyl ether. Other suitable PEG derivatives include PEG-silicon derived
25 ethers. Many of these polymers are commercially available in a variety of molecular weights. Others may be conveniently prepared from commercially available materials, such as by coupling of an amino-PEG moiety to a haloalkyl silyl or silane moiety.

Suitable PEGs may vary in molecular weight from about 200 g/mol to about 20,000 g/mol or more, more preferably 200 g/mol to 5,000 g/mol, even more

The term "mammal" as used herein preferably refers to the organisms of the class known as "mammalia", such as mice, rats, rabbits, guinea pigs, goats, sheep, horses, cows, dogs, cats, monkeys, apes, humans, and the like; more preferably
15 dogs, cats, monkeys, apes, humans, and the like; and most preferably humans.

The term "abnormal condition" refers to a function in the cells or tissues of a patient that deviates from normal functions in that patient. An abnormal condition can relate to cell proliferation (e.g., be a cell proliferative disorder) as described herein.

20 The term "cell proliferative disorder" as used herein refers to a disorder where an excess cell proliferation of one or more subset of cells in a multicellular organism occurs resulting in harm (e.g., discomfort or decreased life expectancy) to the multicellular organism. The excess cell proliferation can be determined by reference to the general population and/or by reference to a particular patient (e.g., at an earlier
25 point in the patient's life). Hyper-proliferative cell disorders can occur in different types of animals and in humans, and produce different physical manifestations depending upon the affected cells. Hyper-proliferative cell disorders include without limitation cancers, blood vessel proliferative disorders, fibrotic disorders, autoimmune disorders, and the like. Cell proliferative disorders suitable for
30 treatment in accordance with the present invention include without limitation cancers (e.g., erythroblastoma, glioblastoma, meningioma, astrocytoma, melanoma,

myoblastoma, breast cancers, gastric cancers, ovarian cancers, renal cancers, hepatic cancers, pancreatic cancers, bladder cancers, thyroid cancers, prostate cancers, colorectal cancers, solid tumor cancers, colon cancer, brain cancer, blood cancers, bone cancers, liver cancer, kidney cancer, stomach cancer, lung cancer, Kaposi's
5 sarcoma, non-small cell lung cancer, skin cancer, and the like, non-small cell lung cancers, and the like).

In reference to the treatment of abnormal conditions caused, in whole or in part, by a cell proliferative disorder, a therapeutic effect refers to one or more of the following: (a) reducing tumor size; (b) inhibiting (e.g, slowing or stopping) tumor
10 metastasis; (c) inhibiting tumor growth; and (d) relieving to some extent one or more of the symptoms associated with the abnormal condition.

Thus, the present invention features methods of preventing or treating an abnormal condition in a patient in need of treatment comprising: (a) diluting a parenteral formulation into a pharmaceutically acceptable solution, said parenteral

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The instant invention features parenteral and oral formulations for indolinone compounds that are ionizable as free acids or free bases. In particular, the
10 formulations aid the administration of indolinones that are ionizable as free acids or free bases to patients in need of treatment.

1. Properties of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid

15 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid, is an indolinone compound that is a potent inhibitor of signal transduction via Flk-1/KDR, PDGF receptor, and FGF receptor. It is also efficacious in inhibiting SC growth of multiple tumor types and inhibited the growth of established tumors. This compound is a preferred compound for use in the
20 formulations of the present invention. Properties of formulations comprising this compound are set forth in the experimental materials that follow.

2. PHARMACEUTICAL COMPOSITIONS AND USES

A compound or combination of the present invention, a prodrug thereof or a
25 physiologically acceptable salt of either the compound or its prodrug, can be administered as such to a human patient or it can be administered in pharmaceutical compositions or formulations in which the foregoing materials are mixed with suitable carriers or excipient(s). Techniques for formulation and administration of drugs may be found in "Remington's Pharmacological Sciences," Mack Publishing
30 Co., Easton, PA, latest edition.

A. Routes of Administration.
General

Suitable routes of administration may include, without limitation, oral, rectal, transmucosal or intestinal administration or intramuscular, subcutaneous, intramedullary, intrathecal, direct intraventricular, intravenous, intraperitoneal, intranasal, or intraocular injections. The preferred routes of administration are oral and parenteral.

Alternatively, one may administer the compound in a local rather than systemic manner, for example, via injection of the compound directly into a solid tumor, often in a depot or sustained release formulation.

Furthermore, one may administer the drug in a targeted drug delivery system, for example, in a liposome coated with tumor-specific antibody. The liposomes will be targeted to and taken up selectively by the tumor.

B. Composition/Formulation

General

Pharmaceutical compositions and formulations of the present invention may be manufactured by processes well known in the art; e.g., by means of conventional mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping or lyophilizing processes.

Pharmaceutical compositions and formulations for use in accordance with the present invention may be formulated in conventional manner using one or more physiologically acceptable carriers comprising excipients and auxiliaries which facilitate processing of the active compounds into preparations which can be used pharmaceutically. Proper formulation is dependent upon the route of administration chosen.

For injection, the compounds of the invention may be formulated in aqueous solutions, preferably in physiologically compatible buffers such as Hanks' solution, Ringer's solution, or physiological saline buffer. For transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art.

For oral administration, the compounds can be formulated by combining the active compounds with pharmaceutically acceptable carriers well known in the art. Such carriers enable the compounds of the invention to be formulated as tablets, pills, lozenges, dragees, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient. Pharmaceutical preparations and formulations for oral use can be made using a solid excipient, optionally grinding the resulting mixture, and processing the mixture of granules, after adding other suitable auxiliaries if desired, to obtain tablets or dragee cores. Useful excipients are, in particular, fillers such as sugars, including lactose, sucrose, mannitol, or sorbitol; cellulose preparations such as, for example, maize starch, wheat starch, rice starch and potato starch and other materials such as gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethylcellulose, sodium carboxymethylcellulose, and/or polyvinylpyrrolidone (PVP). If desired, disintegrating agents may be added, such as cross-linked polyvinylpyrrolidone, agar, or alginic acid. A salt such as sodium alginate may also be used.

Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active compound doses.

Pharmaceutical compositions and formulations which can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the active ingredients in admixture with a filler such as lactose, a binder such as starch, and/or a lubricant such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds may be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols. Stabilizers may be added in these formulations, also.

For buccal administration, the compositions and formulations may take the form of tablets or lozenges formulated in conventional manner.

For administration by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of an aerosol spray using a pressurized pack or a nebulizer and a suitable propellant, e.g., without limitation, dichlorodifluoromethane, trichlorofluoromethane, dichlorotetra- fluoroethane or carbon dioxide. In the case of a pressurized aerosol, the dosage unit may be controlled by providing a valve to deliver a metered amount. Capsules and cartridges of, for example, gelatin for use in an inhaler or insufflator may be formulated containing a powder mix of the compound and a suitable powder base such as lactose or starch.

The compounds may also be formulated for parenteral administration, e.g., by bolus injection or continuous infusion. Formulations for injection may be presented in unit dosage form, e.g., in ampoules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulating materials such as suspending, stabilizing and/or dispersing agents.

Pharmaceutical compositions and formulations for parenteral administration include aqueous solutions of a water soluble form, such as, without limitation, a salt, of the active compound. Additionally, suspensions of the active compounds may be prepared in a lipophilic vehicle. Suitable lipophilic vehicles include fatty oils such as sesame oil, synthetic fatty acid esters such as ethyl oleate and triglycerides, or materials such as liposomes. Aqueous injection suspensions may contain substances which increase the viscosity of the suspension, such as sodium carboxymethyl cellulose, sorbitol, or dextran. Optionally, the suspension may also contain suitable stabilizers and/or agents that increase the solubility of the compounds to allow for the preparation of highly concentrated solutions.

Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, e.g., sterile, pyrogen-free water, before use.

The compounds may also be formulated in rectal compositions such as suppositories or retention enemas, using, e.g., conventional suppository bases such as cocoa butter or other glycerides.

In addition to the formulations described previously, the compounds may also be formulated as depot preparations. Such long acting formulations may be administered by implantation (for example, subcutaneously or intramuscularly) or by intramuscular injection. A compound of this invention may be formulated for this route of administration with suitable polymeric or hydrophobic materials (for instance, in an emulsion with a pharmacologically acceptable oil), with ion exchange resins, or as a sparingly soluble derivative such as, without limitation, a sparingly soluble salt.

A non-limiting example of a pharmaceutical carrier for the hydrophobic compounds of the invention is a cosolvent system comprising benzyl alcohol, a nonpolar surfactant, a water-miscible organic polymer and an aqueous phase such as the VPD co-solvent system. VPD is a solution of 3% w/v benzyl alcohol, 8% w/v of the nonpolar surfactant Polysorbate 80™, and 65% w/v polyethylene glycol 300, made up to volume in absolute ethanol. The VPD co-solvent system (VPD:D5W) consists of VPD diluted 1:1 with a 5% dextrose in water solution. This co-solvent system dissolves hydrophobic compounds well, and itself produces low toxicity upon systemic administration. The proportions of such a co-solvent system may be varied considerably without destroying its solubility and toxicity characteristics. Furthermore, the identity of the co-solvent components may be varied: for example, other low-toxicity nonpolar surfactants may be used instead of Polysorbate 80™; the fraction size of polyethylene glycol may be varied; other biocompatible polymers may replace polyethylene glycol, *e.g.*, polyvinyl pyrrolidone; and other sugars or polysaccharides may substitute for dextrose.

Alternatively, other delivery systems for hydrophobic pharmaceutical compounds may be employed. Liposomes and emulsions are well known examples of delivery vehicles or carriers for hydrophobic drugs. In addition, certain organic solvents such as dimethylsulfoxide also may be employed, although often at the cost of greater toxicity.

Additionally, the compounds and formulations may be delivered using a sustained-release system, such as semi-permeable matrices of solid hydrophobic

polymers containing the therapeutic agent. Various sustained-release materials have been established and are well known by those skilled in the art.

The pharmaceutical compositions and formulations herein also may comprise suitable solid or gel phase carriers or excipients. Examples of such carriers or excipients include, but are not limited to, calcium carbonate, calcium phosphate, various sugars, starches, cellulose derivatives, gelatin, and polymers such as polyethylene glycols.

Many of the compounds of the invention may be provided as salts with pharmaceutically compatible counterions. Pharmaceutically compatible salts may be formed with many acids, including but not limited to hydrochloric, sulfuric, acetic, lactic, tartaric, malic, succinic, etc. Salts tend to be more soluble in aqueous or other protonic solvents than are the corresponding free base forms.

3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid composition

This compound may be formulated as any of the compositions and formulations described above. Presently preferred formulations, however, comprise 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid composition in sufficient sterile parenteral solution to afford a final concentration of about 10 mg/ml.

3. DOSAGE

A. General

Compounds, combinations, and pharmaceutical compositions and formulations suitable for use in the present invention include compositions wherein the active ingredients are contained in an amount sufficient to achieve the intended purpose; i.e., the modulation of protein kinase (PK) activity or the treatment or prevention of a PK-related disorder.

The above referenced protein kinase related disorder is selected from the group consisting of an EGFR related disorder, a PDGFR related disorder, an IGFR related disorder and a flk related disorder.

The above referenced protein kinase related disorder is a cancer selected from the group consisting of squamous cell carcinoma, sarcomas such as Kaposi's sarcoma, astrocytoma, glioblastoma, lung cancer, bladder cancer, colorectal cancer, gastrointestinal cancer, head and neck cancer, melanoma, ovarian cancer, prostate
5 cancer, breast cancer, small-cell lung cancer and glioma in a further aspect of this invention.

The above referenced protein kinase related disorder is selected from the group consisting of diabetes, a hyper- proliferation disorder, von Hippel-Lindau disease, restenosis, fibrosis, psoriasis, osteoarthritis, rheumatoid arthritis, an
10 inflammatory disorder and angiogenesis in yet another aspect of this invention.

Additional disorders which may be treated or prevented using the compounds of this invention are immunological disorders such as autoimmune disease (AIDS) and cardiovascular disorders such as atherosclerosis.

More specifically, a therapeutically effective amount means an amount of
15 compound effective to prevent, alleviate or ameliorate symptoms of disease or prolong the survival of the subject being treated.

Determination of a therapeutically effective amount is well within the capability of those skilled in the art, especially in light of the detailed disclosure provided herein.

20 For any compound used in the methods of the invention, the therapeutically effective amount or dose can be estimated initially from cell culture assays. Then, the dosage can be formulated for use in animal models so as to achieve a circulating concentration range that includes the IC_{50} as determined in cell culture (i.e., the concentration of the test compound which achieves a half-maximal inhibition of the
25 PK activity). Such information can then be used to more accurately determine useful doses in humans.

Toxicity and therapeutic efficacy of the compounds described herein can be determined by standard pharmaceutical procedures in cell cultures or experimental animals, e.g., by determining the IC_{50} and the LD_{50} (both of which are discussed
30 elsewhere herein) for a subject compound. The data obtained from these cell culture assays and animal studies can be used in formulating a range of dosage for use in

humans. The dosage may vary depending upon the dosage form employed and the route of administration utilized. The exact formulation, route of administration and dosage can be chosen by the individual physician in view of the patient's condition. (See e.g., Fingl, et al., 1975, in "The Pharmacological Basis of Therapeutics", Ch. 1
5 p.1).

Therapeutic compounds should be more potent in inhibiting receptor tyrosine kinase activity than in exerting a cytotoxic effect. A measure of the effectiveness and cell toxicity of a compound can be obtained by determining the therapeutic index; i.e., IC_{50}/LD_{50} . IC_{50} , the dose required to achieve 50% inhibition, can be
10 measured using standard techniques such as those described herein. LD_{50} , the dosage which results in 50% toxicity, can also be measured by standard techniques as well (Mossman, 1983, J. Immunol. Methods, 65:55-63), by measuring the amount of LDH released (Korzeniewski and Callewaert, 1983, J. Immunol. Methods, 64:313; Decker and Lohmann-Matthes, 1988, J. Immunol. Methods, 115:61), or by
15 measuring the lethal dose in animal models. Compounds with a large therapeutic index are preferred. Thus, in one aspect of the invention, a preferred dosage of the compounds, agents, combinations, and pharmaceutical compositions contemplated for use in the invention requires the therapeutic index of each active component to be greater than 2, preferably at least 10, more preferably at least 50.

20 Dosage amount and interval may be adjusted individually to provide plasma levels of the active species, which are sufficient to maintain the kinase modulating effects. These plasma levels are referred to as minimal effective concentrations (MECs). The MEC will vary for each compound but can be estimated from in vitro data; e.g., the concentration necessary to achieve 50-90% inhibition of a kinase may
25 be ascertained using the assays described herein. Dosages necessary to achieve the MEC will depend on individual characteristics and route of administration. HPLC assays or bioassays can be used to determine plasma concentrations.

Dosage intervals can also be determined using MEC value. Compounds should be administered using a regimen that maintains plasma levels above the MEC
30 for 10-90% of the time, preferably between 30-90% and most preferably between 50-90%.

In cases of local administration or selective uptake, the effective local concentration of the drug may not be related to plasma concentration and other procedures known in the art may be employed to determine the correct dosage amount and interval.

- 5 The amount of a composition administered will, of course, be dependent on the subject being treated, the severity of the affliction, the manner of administration, the judgment of the prescribing physician, etc.

Therapeutically Effective Amounts

- 15 In general, a "therapeutically effective amount" refers to that amount of an agent or its metabolite which is effective to prevent, alleviate, reduce or ameliorate symptoms of disease and/or the undesired side effects attributable to treatment of disease with another agent or its metabolite, or to prolong the survival of the patient being treated. More particularly, in reference to the treatment of cancer, a therapeutically effective amount refers to that amount which has the effect of (1) reducing the size of (or preferably eliminating) the tumor; (2) inhibiting (that is, 20 slowing to some extent, preferably stopping) tumor metastasis; (3) inhibiting to some extent (that is slowing to some extent, preferably stopping) tumor growth; and/or, (4) relieving to some extent (or preferably eliminating) one or more symptoms associated with the cancer and/or one or more undesired side effects attributable to treatment of the cancer with another agent or its metabolite. Non- 25 limiting examples of therapeutically effective amounts of particular agents and compounds contemplated for use in the present invention are further described below.

- 30 In addition to the above general definition, by a "therapeutically effective amount" of an agent is meant any amount administered in any manner and in any treatment regime as may be currently recognized in the medical arts or as may come about as the result of future developments regarding the use of these agents.

A "treatment regime" refers to specific quantities of the ionizable substituted indolinone contemplated for use in this invention) administered at set times in a set manner over an established time period.

When referring to "set times" of administration within a treatment regime,
5 "consecutive days" means consecutive calendar days; i.e., Monday, Tuesday, Wednesday, etc. "Staggered" days means calendar days with other calendar days between them, e.g., without limitation, Monday, Wednesday, Saturday, etc.

Furthermore, with regard to a "therapeutically effective amount" of an ionizable substituted indolinone, the phrase refers to an amount of the compound
10 sufficient to inhibit the growth, size and vascularization; i.e., angiogenesis and/or vasculogenesis, of tumors during the "recovery" periods, i.e., the periods in a treatment regime when no other chemotherapeutic agent is being administered to a patient.

15 Specific Amounts

Based on the pharmacological data obtained regarding 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid composition (see above), the compound may be administered in doses ranging from about 1 mg/m² to about 3000 mg/m². In a presently preferred embodiment, the dosage is
20 between about 50 mg/m² and about 2400 mg/m². In another preferred embodiment, therapeutically effective amounts of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid composition comprise from about 50 to about 800 mg/m². Of course, the dose would depend on a number of factors, including patient specific factor, e.g., weight, dosing regimen (e.g., frequency, route
25 of administration, effect of food) etc.

The formulation(s) described in the above composition section may be administered to a patient at a rate of from about 0.1 to about 200 cc/hour. The rate of administration for a particular patient is dependent on achieving therapeutically relevant plasma levels for the particular indication. The prescribing physician is
30 skilled in making such as determination.

By "about," wherever the term appears herein, is meant $\pm 10\%$; i.e., about 175 cc/hour means from 157.5 cc/hour to 192.5 cc/hour, etc.

In a presently preferred embodiment, the 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid composition dose is administered during rest periods when no other agent is being administered to a patient.

SYNTHESIS EXAMPLES

5

The compounds of this invention, as well as the precursor 2-oxindoles and aldehydes, may be readily synthesized using techniques well known in the chemical arts. It will be appreciated by those skilled in the art that other synthetic pathways for forming the compounds of the invention are available and that the following is offered by way of example and not limitation.

A. General synthetic procedure.

The following general methodology may be employed to prepare the compounds of this invention:

The appropriately substituted 2-oxindole (1 equiv.), the appropriately substituted aldehyde (1.2 equiv.) and a base (0.1 equiv.) are mixed in a solvent (1-2 ml/mmol 2-oxindole) and the mixture is then heated for from about 2 to about 12 hours. After cooling, the precipitate that forms is filtered, washed with cold ethanol or ether and vacuum dried to give the solid product. If no precipitate forms, the reaction mixture is concentrated and the residue is triturated with dichloromethane/ether, the resulting solid is collected by filtration and then dried. The product may optionally be further purified by chromatography.

The base may be an organic or an inorganic base. If an organic base is used, preferably it is a nitrogen base. Examples of organic nitrogen bases include, but are not limited to, diisopropylamine, trimethylamine, triethylamine, aniline, pyridine, 1,8-diazabicyclo[5.4.1]undec-7-ene, pyrrolidine and piperidine.

Examples of inorganic bases are, without limitation, ammonia, alkali metal or alkaline earth hydroxides, phosphates, carbonates, bicarbonates, bisulfates and amides. The alkali metals include, lithium, sodium and potassium while the alkaline earths include calcium, magnesium and barium.

In a presently preferred embodiment of this invention, when the solvent is a protic solvent, such as water or alcohol, the base is an alkali metal or an alkaline earth inorganic base, preferably, a alkali metal or an alkaline earth hydroxide.

It will be clear to those skilled in the art, based both on known general principles of organic synthesis and on the disclosures herein which base would be most appropriate for the reaction contemplated.

The solvent in which the reaction is carried out may be a protic or an aprotic solvent, preferably it is a protic solvent. A "protic solvent" is a solvent which has hydrogen atom(s) covalently bonded to oxygen or nitrogen atoms which renders the hydrogen atoms appreciably acidic and thus capable of being "shared" with a solute through hydrogen bonding. Examples of protic solvents include, without limitation, water and alcohols.

An "aprotic solvent" may be polar or non-polar but, in either case, does not contain acidic hydrogens and therefore is not capable of hydrogen bonding with solutes. Examples, without limitation, of non-polar aprotic solvents, are pentane, hexane, benzene, toluene, methylene chloride and carbon tetrachloride. Examples of polar aprotic solvents are chloroform, tetrahydro- furan, dimethylsulfoxide and dimethylformamide.

In a presently preferred embodiment of this invention, the solvent is a protic solvent, preferably water or an alcohol such as ethanol.

The reaction is carried out at temperatures greater than room temperature. The temperature is generally from about 30° C to about 150° C, preferably about 80°C to about 100° C, most preferable about 75° C to about 85° C, which is about the boiling point of ethanol. By "about" is meant that the temperature range is preferably within 10 degrees Celcius of the indicated temperature, more preferably within 5 degrees Celcius of the indicated temperature and, most preferably, within 2 degrees Celcius of the indicated temperature. Thus, for example, by "about 75° C" is meant 75° C \pm 10° C, preferably 75° C \pm 5° C and most preferably, 75° C \pm 2° C.

B. Synthetic methods used in the examples which follow:

Method A: Formylation of pyrroles

POCl₃ (1.1 equiv.) is added dropwise to dimethylformamide (3 equiv.) at -10° C followed by addition of the appropriate pyrrole dissolved in dimethylformamide. After stirring for two hours, the reaction mixture is diluted with H₂O and basified to pH 11 with 10 N KOH. The precipitate which forms is collected by filtration, washed with H₂O and dried in a vacuum oven to give the desired aldehyde.

Method B: Saponification of pyrrolecarboxylic acid esters

A mixture of a pyrrolecarboxylic acid ester and koh (2 – 4 equiv.) in etoh is refluxed until reaction completion is indicated by thin layer chromatography (tlc). The cooled reaction mixture is acidified to pH 3 with 1 N HCl. The precipitate which forms is collected by filtration, washed with H₂O and dried in a vacuum oven to give the desired pyrrolecarboxylic acid.

Method C: Amidation

To a stirred solution of a pyrrolecarboxylic acid dissolved in dimethylformamide (0.3M) is added 1-ethyl-3-(3-dimethylamino-propyl)carbodiimide (1.2 equiv.), 1-hydroxybenzotriazole (1.2 equiv.), and triethylamine (2 equiv.). The appropriate amine is added (1 equiv.) and the reaction stirred until completion is indicated by TLC. Ethyl acetate is then added to the reaction mixture and the solution washed with saturated NaHCO₃ and brine (with extra salt), dried over anhydrous MgSO₄ and concentrated to afford the desired amide.

Method D: Condensation of aldehydes and oxindoles containing carboxylic acid substituents

A mixture of the oxindole (1 equivalent), 1 equivalent of the aldehyde and 1 – 3 equivalents of piperidine (or pyrrolidine) in ethanol (0.4 M) is stirred at 90-100° C until reaction completion is indicated by TLC. The mixture is then concentrated and the residue acidified with 2N HCl. The precipitate that forms is washed with H₂O and EtOH and then dried in a vacuum oven to give the product.

30

Method E: Condensation of aldehydes and oxindoles not containing carboxylic acid substituents

A mixture of the oxindole (1 equivalent), 1 equivalent of the aldehyde and 1 – 3 equivalents of piperidine (or pyrrolidine) in ethanol (0.4 M) is stirred at 90-100° C until reaction completion is indicated by TLC. The mixture is cooled to room temperature and the solid which forms is collected by vacuum filtration, washed with ethanol and dried to give the product. If a precipitate does not form upon cooling of the reaction mixture, the mixture is concentrated and purified by column chromatography.

The thick dark red mixture was heated to reflux for 0.5 hr, concentrated to a dark red solid, and treated with 10% sodium hydroxide until almost all of the solid dissolved. The dark red mixture was treated with 30% hydrogen peroxide until the red color

changed to yellow. The mixture was treated alternately with 10% sodium hydroxide and 30% hydrogen peroxide until the dark red color was no longer present. The solid was filtered off and the filtrate acidified with 6N hydrochloric acid. The resulting precipitate was collected by vacuum filtration, washed with water, and dried under vacuum to give 9.8 g (45% yield) of 2-methyl-6-nitrophenylacetic acid as an off-white solid. D. Aldehydes

25 5-Formyl-2,4-dimethyl-1H-pyrrole-3-carboxylic acid

t-Butyl-3-oxobutyrate (158 g, 1 mol) was dissolved in 200 mL of acetic acid in a 500 mL 3-neck round bottom flask equipped with a thermometer, addition funnel and mechanical stirring. The mixture was cooled in an ice bath to about 10 °C. Sodium nitrite (69 g, 1 mol) was added over 75 minutes keeping the temperature
30 under 15 °C. The cold bath was removed and the mixture stirred for 30 minutes and then allowed to stand for 3.5 hours to give t-butyl-2-hydroximino-3-oxobutyrate.

Ethyl-3-oxobutyrate (130 g, 1 mol) was dissolved in 400 mL of acetic acid in a 2 L 3-neck round bottom flask equipped with a thermometer, an addition funnel,

mechanical stirring and placed in an oil bath. Zinc dust (50 g, 0.76 mol) was added and the mixture heated to 60 °C with stirring. The t-butyl-2-hydroximino-3-oxobutyrate solution prepared above was slowly added, the temperature of the reaction mixture being maintained at about 65 °C. More zinc dust was then added (4 x 50 g, 3.06 mol) with the last portion added after all the t-butyl ester had been added. At the end of the additions the temperature was 64 °C. The temperature was increased to 70 - 75 °C, stirred for one hour and then poured into 5 L of water. The gray floating precipitate was collected by vacuum filtration and washed with 2 L of water to give 354 g of wet crude product. The crude product was dissolved in 1 L of hot methanol and filtered hot to remove zinc. The filtrate was cooled upon which a precipitate formed. The precipitate that was collected by vacuum filtration and dried to give 118 g of product. The filtrate was put in the refrigerator overnight upon which additional product precipitated. A total of 173.2 g of 3,5-dimethyl-1H-pyrrole-2,4-dicarboxylic acid 2-tert-butyl ester 4-ethyl ester was obtained.

3,5-Dimethyl-1H-pyrrole-2,4-dicarboxylic acid 2-tert-butyl ester 4-ethyl ester (80.1 g, 0.3 mol) and 400 mL trifluoroacetic acid were stirred for 5 minutes in a 2 L 3-neck round bottom flask equipped with mechanical stirring and warmed to 40 °C in an oil bath. The mixture was then cooled to -5 °C and triethyl orthoformate (67.0 g, 0.45 mol) was added all at once. The temperature increased to 15 °C. The mixture was stirred for about 1 minute, removed from the cold bath and then stirred for 1 hour. The trifluoroacetic acid was removed by rotary evaporation and the residue put in the refrigerator where it solidified. The solid was dissolved by warming and poured into 500 g of ice. The mixture was extracted with 800 mL of dichloromethane to give a red solution and a brown precipitate, both of which were saved. The precipitate was isolated and washed with 150 mL of saturated sodium bicarbonate solution. The dichloromethane phase was also washed with 150 mL of sodium bicarbonate. The dichloromethane solution was then washed 3 more times with 100 mL of water. The dichloromethane solution was evaporated to dryness. The dark residue which remained was recrystallized twice from ethyl acetate containing Darco carbon black to give golden yellow needles. The brown precipitate

was recrystallized from 350 mL ethyl acetate likewise containing Darco to give a yellow-red solid. All the recrystallized solids were combined and recrystallized from 500 mL of ethanol to give 37.4 g (63.9 %) of 5-formyl-2,4-dimethyl-1H-pyrrole-3-carboxylic acid ethyl ester as yellow needles (mp 165.6 -166.3 °C, lit. 163 -164 °C). The residues obtained after evaporating of the ethyl acetate and ethanol mother liquors were combined and recrystallized from 500 mL of ethanol to give a second crop (10.1 g) or product as dirty yellow needles.

5-Formyl-2,4-dimethyl-1H-pyrrole-3-carboxylic acid ethyl ester (2 g, 10 mmol) was added to a solution of potassium hydroxide (3 g, 53 mmol) dissolved in methanol (3 mL) and water (10 mL). The mixture was refluxed for 3 hours, cooled to room temperature and acidified with 6 N hydrochloric acid to pH 3. The solid which formed was collected by filtration, washed with water and dried in a vacuum oven overnight to give 1.6 g (93%) of 5-formyl-2,4-dimethyl-1H-pyrrole-3-carboxylic acid.

To a mixture of 5-formyl-2,4-dimethyl-1H-pyrrole-3-carboxylic acid (1.67 g, 10 mmol) in dimethylformamide (10 mL) was added benzotriazol-1-yloxytris(dimethylamino)- phosphonium hexafluorophosphate (BOP reagent, 6 g, 13.5 mmol) followed by 3 mL diisopropylethylamine. After stirring for 5 minutes, 1 mL of N,N-dimethylethylendiamine was added and the mixture was stirred at room temperature for 24 hours. To the reaction mixture was added 25 mL of 1N sodium hydroxide and 25 mL of brine. After stirring for 30 minutes, the reaction mixture was poured into water (100 mL) and extracted (3 x 200 mL) with 10% of methanol in dichloromethane. The organic layers were combined, dried over anhydrous sodium sulfate and evaporated using a rotary evaporator. The residue which remained was purified by chromatography (silica gel column, 5%-10% methanol in dichloromethane) to give 1 g (42%) of 5-formyl-2,4-dimethyl-1H-pyrrole-3-carboxylic acid (2-dimethylamino-ethyl)-amide.

The reaction mixture was poured into H₂O and the filtrate was collected to give (65%) 2-*tert*-butyloxycarbonyl-3,5-dimethyl-4-ethoxycarbonylpyrrole.

A mixture of 2-*tert*-butyloxycarbonyl-3,5-dimethyl-4-ethoxycarbonylpyrrole and triethyl orthoformate (1.5 equiv.) in trifluoroacetic acid was stirred at 15°C for 1 hour. The reaction was concentrated and the residue was purified to give (64%) 2,4-dimethyl-3-ethoxycarbonyl-5-formylpyrrole as yellow needles.

5 2,4-Dimethyl-3-ethoxycarbonyl-5-formylpyrrole was hydrolyzed using method B to give (90%) 5-formyl-2,4-dimethyl-1*H*-pyrrole-3-carboxylic acid.

Example 4 (from Table 3)

25 3-[4-Methyl-5-(2-oxo-1,2-dihydroindol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid

Sodium metal (1.5 g) was placed in a 3 L 3-neck round bottom flask equipped with a thermometer, reflux condenser and mechanical stirring and placed in an oil bath. Absolute ethanol (1 L) was added with stirring. When the sodium had dissolved, 350 g of pentan-2,4-dione was added all at once and then 310 g of ethyl acrylate added over 30 minutes. The mixture was refluxed for 2.5 hours and

then allowed to cool to room temperature overnight. Glacial acetic acid (3 mL) was added and the solvent removed by rotary evaporation. The residue was filtered through a pad of diatomaceous earth and distilled in a wiped film still at 0.1 mm. The distillate was redistilled using a 10 inch vacuum jacketed Vigreux column to
5 give 518 g of ethyl 5-acetyl-4-oxohexanoate, BP 84 - 92 °C at 0.2 - 0.7 mm.

To a 5 L three-neck flask equipped with a thermometer and a mechanical stirrer and heated on a steam bath was added 350 g ethyl 5-acetyl-4-oxohexanoate, 329 g ethyl aminomalonate hydrochloride, 133 g sodium acetate and 1.2 L acetic acid. The mixture was heated to 99 °C over 37 minutes. By 62 °C, carbon dioxide
10 evolution was already rapid. After a total of 35 minutes at 99 °C gas, CO₂ evolution had greatly slowed. After another hour, the mixture was cooled, sodium chloride removed by vacuum filtration, and the solvent evaporated. The residue was mixed with 1 L of cold water. The precipitate was collected by vacuum filtration, washed with 400 mL water, and dissolved in 1 L of hot 95 % ethanol. The solution was
15 treated with 20 g of Darco G-60, hot-filtered, and cooled to room temperature. The crystalline solid was collected by vacuum filtration, washed twice on the filter with 200 mL of 50 % ethanol and dried under vacuum at 70 °C to give 285 g (64 % yield) of 2-ethoxycarbonyl-4-(2-ethoxycarbonylethyl)-3,5-dimethylpyrrole. The filtrate was refrigerated overnight to give another 53.1 g (11.9 % yield) of product for a
20 total yield of 75.9 %).

2-Ethoxycarbonyl-4-(2-ethoxycarbonylethyl)-3,5-dimethylpyrrole (285 g) and 3500 mL of ethyl ether was placed in a 5 L, 3 neck flask equipped with a mechanical stirrer, a reflux condenser and an addition funnel and cooled in an ice bath. Sulfuryl chloride (435 g) was added dropwise over 145 minutes. As the
25 addition proceeded the mixture turned cloudy and green, then cleared. At the end of the addition the mixture was clear and faintly yellow. The mixture was stirred for 1 additional hour and then heated to reflux for 1 hour. The mixture was cooled and rotary evaporated, diluted with 1500 mL of ether, and rotary evaporated again. The dilution and evaporation was repeated again. The residue was added to 8 L of water
30 containing 802 g of acetic acid and 535 g of sodium hydroxide. The mixture was briefly heated to 85 °C and then allowed to cool overnight with stirring. The

aqueous layer, which contained solids, was separated and extracted with 800 mL of ether. The solids and the ether layer were added to 2.5 L of water containing 300 g of sodium carbonate, stirred for 1 hour and filtered to remove a small amount (~ 7 g) of solid. Sulfurous acid (137 g) was added to the mixture and the resulting
5 precipitate washed twice with 250 mL of water and dried under vacuum to give 56.4 g of product. Sulfurous acid (92 g) was added to the filtrate and the resulting precipitate washed twice with 0.5 L of water and dried under vacuum to give 220 g of product for a total of 276.4 g (86.8 % yield) of 2-carboxy-5-ethoxycarbonyl-3-(2-ethoxycarbonylethyl)-4-methylpyrrole.

10 2-Carboxy-5-ethoxycarbonyl-3-(2-ethoxycarbonylethyl)-4-methylpyrrole (50.5 g) and 400 ml 10 % sodium hydroxide solution was heated to 180 °C in a Parr autoclave for 90 minutes. This process was repeated 4 more times until a total of 252.5 g of 2-carboxy-5-ethoxycarbonyl-3-(2-ethoxycarbonylethyl)-4-methylpyrrole had been treated. The five solutions were combined and rotary evaporated to a
15 volume of about 1.8 L of thick black residue. The mixture was cooled to 10 °C in a water bath and 50 % sulfuric acid was slowly added so as to keep the temperature at < 20 °C until the pH was 2. Ethyl ether (1400 mL) was added, the mixture filtered and the precipitate saved. The precipitate was extracted in a Soxhlet extractor with 500 mL of ether. The combined ether layers were washed with 250 mL water
20 followed by 150 mL of water. The combined water layers were back extracted with 150 mL of ether. All the ether layers were rotary evaporated and the residue dried to give 123.5 g of 3-(2-carboxyethyl)-4-methylpyrrole.

3-(2-Carboxyethyl)-4-methylpyrrole (123 g) was mixed with 1500 mL of ethyl ether and 250 mL of methanol in a magnetically stirred receiver flask. A separate 3
25 L, 3 neck round bottom flask was equipped with magnetic stirring, a distillation head and condenser leading to the inlet of the receiver flask, and heated in a water bath. Into the 3 L flask was placed 240 g of Diazald dissolved in 1800 mL of ethyl ether and a solution of 73 g of potassium hydroxide dissolved in 360 mL of 95 % ethanol and 112 mL of water. The 3 L flask was stirred and heated to 65 - 75 °C in a water
30 bath and the diazomethane-ether mixture was distilled into the stirred receiver flask over about 2.5 hours. Ethyl ether (200 mL) was added to the 3 L flask and the

distillation continued until complete. The receiver flask was stirred for another 30 minutes and then 10 mL of acetic acid was added. The mixture was extracted twice with 500 mL of water, then twice with 200 mL of saturated sodium bicarbonate. The ether layer was dried over anhydrous sodium sulfate and distilled to leave a dark fluid
5 residue. The residue was distilled twice through a 4 inch Vigreux column and once through a 10 inch vacuum-jacketed Vigreux column to give 108 g (80.6 % yield) of 3-(2-ethoxycarbonyl-ethyl)-4-methylpyrrole. BP 108 - 113 °C at 0.5 mm.

Dimethylformamide was charged to a 500 mL, 3 neck round bottom flask equipped with mechanical stirring, a thermometer and a dropping funnel and
10 maintained under a nitrogen atmosphere. The flask was cooled to 0 °C and 58.4 mL of phosphorus oxychloride was added dropwise over 80 minutes. Dichloroethane (280 mL) was added and the mixture allowed to warm to room temperature and then cooled to -10 °C. 3-(2-methoxycarbonyl-ethyl)-4-methylpyrrole (55.7 g) dissolved in 80 mL dichloroethane was added dropwise over 1 hour and the mixture stirred for
15 another 35 minutes. The mixture was rotary evaporated at < 30 °C. The fluid residue was poured into 2700 mL of ice-cold 2 N sodium hydroxide solution. The resulting solution was heated to 88 °C over 20 minutes and then maintained at this temperature for an additional 30 minutes. The solution was cooled to ambient temperature and extracted with 200 mL of ethyl ether. The aqueous solution was
20 cooled to 0 °C and acidified to pH 3.5 by slowly adding about 1350 mL of 5 N hydrochloric acid. The yellow precipitate was collected by vacuum filtration, washed four times with 100 mL of water, and dried in a vacuum oven at ambient temperature to give 54.4 g (90.2 % yield) of crude 4-(2-carboxyethyl)-2-formyl-3-methylpyrrole.

25 The crude material was placed in a refluxing mixture of 425 mL of ethanol and 700 mL of ethyl ether and hot filtered to remove an insoluble residue, which was retained. The filtrate was put in the freezer and the resulting precipitate collected by vacuum filtration and washed with 50 mL of ether. The filtrate was used to again extract the insoluble residue, hot filtered and put in the freezer. The
30 resulting precipitate and the first precipitate were combined to give 26.1 g of 4-(2-

carboxyethyl)-2-formyl-3-methylpyrrole as a brown powder, MP 149.0 - 150.3 °C.

The filtrate was combined with the filtrate from a previous preparation and concentrated to give 43 g of a brown solid. The solid was put into a refluxing mixture of 500 ml ether and 100 mL ethanol, filtered. The filtrate treated with Norit at reflux and hot filtered again. The filtrate was put in the freezer to give 3 additional crops of 4-(2-carboxyethyl)-2-formyl-3-ethylpyrrole, 7.7 g, MP 148 - 151 °C, 3.2 g MP 128 - 134 °C and 4.1 g, MP 148.2 - 150.0 °C.

4-(2-Carboxyethyl)-2-formyl-3-methylpyrrole (9.0 g) and 6.0 g of 2-oxindole in 50 mL of ethanol were heated to 70 °C in a 250 mL, 3-neck round bottom flask equipped with a thermometer, a reflux condenser and magnetic stirring. When most of the solids had dissolved, 4.5 g of piperidine was slowly added and the mixture refluxed for 4 hours. Acetic acid (12 mL) was slowly added resulting in a copious precipitate. The mixture was refluxed for 5 minutes, cooled to room temperature and the precipitate collected by vacuum filtration and washed with 30 mL of ethanol. The precipitate was slurry-washed at reflux in 30 mL of ethanol, cooled to room temperature, collected by vacuum filtration, washed with 20 mL of ethanol and dried under vacuum to give 11.9 g (80 % yield) of 3-[4-(2-carboxyethyl)-3-methylpyrrol-2-methylidenyl]-2-indolinone, SU6663, as an orange solid.

3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydroindol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid

2,4-Dimethyl-5-ethoxycarbonyl-3-(2-ethoxycarbonyl-ethyl)-pyrrole (1.07 kg) and 3.2 L 5 N sodium hydroxide were mechanically stirred in a 12 L three-neck round bottom flask equipped with a reflux condenser and an addition funnel and heated in an oil bath. The mixture was refluxed for 3 hours after which time the

internal temperature was 96 °C, all solids were dissolved and thin layer chromatography showed hydrolysis to be complete. The heating bath was removed and the mixture cooled to 50 °C in a water bath. 12N Hydrochloric acid (~1.3 L) was slowly added. After about 50% of the acid was added gas evolution began and the temperature reached 60 °C. As more acid was added, gas evolution increased and a yellow precipitate formed. The final pH was adjusted to 3.5 with hydrochloric acid. The mixture was cooled in an ice bath to 8 °C. The solids were collected by vacuum filtration, washed twice with 0.5 L of distilled water and dried for 48 hours in a vacuum oven at 55-60 °C to give 677 g (101% yield) of 3-(2-carboxyethyl)-2,4-dimethylpyrrole.

Dimethylformamide (28.5 g) in 250 mL of dichloromethane in a 1 L three neck round bottom flask equipped with magnetic stirring, a thermometer and a dropping funnel was cooled in an ice-salt bath to -1 °C. Phosphorus oxychloride (59.3 g) was placed in the dropping funnel and slowly added to the reaction mixture. The funnel was flushed with 25 mL of dichloromethane to be sure all the phosphorus oxychloride. The maximum temperature reached by the mixture was 5 °C. The mixture was stirred for 15 minutes at which time the temperature was -3 °C. Solid 3-(2-Carboxyethyl)-2,4-dimethylpyrrole (32.6 g) was added in portions over 15 minutes. The maximum temperature reached by the mixture was 7 °C. The reddish-black mixture was stirred for 30 minutes more and then heated to reflux for 1 hour. The mixture was cooled to 15 °C and 300 mL of water was added leading to a vigorous reaction during which the temperature increased. The mixture was stirred and cooled to 22 °C and the layers separated and saved. The organic layer was extracted with 100 mL of water and the aqueous layers combined and washed with 50 ml of dichloromethane. The organic layers were discarded. The aqueous layer was adjusted to pH 11 with ~180 mL of 10 N sodium hydroxide. The temperature increased to 40 °C. The mixture was stirred for 30 minutes at which time the

temperature was 27 °C. The mixture was acidified to pH 2 with ~120 mL of 10 N hydrochloric acid which increased the temperature to 30 °C. Ethyl acetate (150 mL) was added and the mixture was stirred to extract the product. During stirring a considerable amount of black solid appeared on top of the water layer. The ethyl acetate layer was separated and the aqueous layer and solid was extracted twice with 100 mL of ethyl acetate. The solid still present was collected by vacuum filtration, washed thoroughly with water and dried under vacuum at 40 °C to give 12 g (31 % yield) of 3-(2-carboxyethyl)-2,4-dimethyl-5-formylpyrrole as a brownish-black solid. Thin layer chromatography (dichloro-methane:acetic acid, 95:5, silica gel) showed a spot at R_f 0.7 and a colored spot at the origin. The ethyl acetate layers were combined, dried over anhydrous sodium sulfate, and evaporated to a brownish-black solid which was dried under vacuum at 40 °C to give 21 g (55 % yield, total yield 86 %) of 3-(2-carboxyethyl)-2,4-dimethyl-5-formylpyrrole, identical in appearance to the previous solid by thin layer chromatography.

Alternatively, dimethylformamide (124 mL) in 750 mL of dichloromethane in a 5 L three-neck round bottom flask equipped with mechanical stirring, a thermometer and a dropping funnel was cooled in an ice-salt bath to -9 °C. Phosphorus oxychloride (114 mL) was added rapidly via the dropping funnel which was flushed into the reaction mixture with 50 mL of dichloromethane. The maximum temperature reached by the mixture was -4 °C. Solid 3-(2-carboxyethyl)-2,4-dimethylpyrrole (133.6 g) was added in portions over 20 minutes. The maximum temperature reached by the mixture was 3 °C. The dark reddish mixture was heated to reflux for 1 minute and then cooled to -1 °C. The mixture was cooled to 1 °C and 800 mL of ice water was rapidly added. The maximum temperature reached was 15 °C. The organic layer was separated and discarded. The aqueous layer was slowly adjusted to pH 12 - 13 with ~800 mL of 10 N potassium hydroxide, adding ice to control the temperature. The temperature increased to 37 °C. The mixture was stirred for 90 minutes at ambient temperature at which time thin layer chromatography showed only a trace of light-colored material at the origin with the product at R_f 0.3. The mixture was cooled to 0 °C. The mixture was acidified to pH

3 with ~600 mL of 10 N hydrochloric acid ice being added to control the temperature. The maximum temperature reached was 10 °C. The mixture was stirred for 1 hour in the cold. The solid was collected by vacuum filtration, washed 4 times with 100 mL of water and dried under vacuum at 50 - 60 °C to give 140.6 g (90 % yield) of 3-(2-carboxyethyl)-2,4-dimethyl-5-formylpyrrole as a brown solid.

Pyrrolidine (7.0 g) was added and the reaction mixture refluxed for 2 hours at which time a large quantity of brown-black solid was present. Thin layer chromatography (ethyl acetate:ethanol:acetic acid 96:2:2, silica gel) showed the absence of oxindole starting material. Eight mL of acetic acid was added and the mixture refluxed for 15 minutes. The thick mixture was diluted with 50 mL of ethanol and cooled to 10 °C. The solid was collected by vacuum filtration and washed with 50 mL of ethanol. The solid was stirred in 125 ml of ethanol at reflux for 10 minutes, cooled to 10 °C, collected by vacuum filtration and washed with 50 mL of ethanol. The product was dried overnight at 45 °C under vacuum to give 25.5 g (88 % yield) of 3-[2,4-dimethyl-3-(2-carboxyethyl) pyrrol-5-methylidenyl]-2-indolinone as an orange solid.

BIOLOGICAL EVALUATION EXAMPLES

25 The examples given below are not limiting and are merely representative of various aspects and features of the present invention. The examples demonstrate parenteral and oral formulations, methods of making such formulations and uses of the formulations. The ionizable free acid, 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid, is used as a representative
30 example for the genus of ionizable free acids and free bases.

EXAMPLE 1: *In vivo* Efficacy of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid

The ability of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid to inhibit subcutaneous (SC) growth of multiple
5 tumor types in athymic mice was evaluated.

Experimental Procedures

Tumor Cell Lines

C6, SKOV3 and A431 cell lines were purchased from the American Type Culture Collection (Rockville, MD). SF763 and SF767 cells were obtained from Dr.
10 Michael Berens (Barrow Neurological Institute). SF763T, SF767T, and SKOV3TP5 are tumor-derived sublines of SF763, SF767, and SKOV3 cells, respectively.

SF763T, SF767T, and SKOV3TP5 were derived by implanting the parental cells SC into BALB/c nu/nu mice. Tumors that displayed desirable growth characteristics were resected and finely minced in a sterile petri dish.

15 For the SF763T and SF767T cell lines, two to five mL of appropriate medium was added to the slurry and the tumor pieces were further mechanically teased apart. The resulting suspension was placed into tissue culture flasks and incubated with the appropriate culture medium supplemented with 100 units/mL penicillin G sodium and 100 µg/mL streptomycin sulfate (Gibco, Grand Island, NY).
20 Medium was changed every two to three days. After three to five passages, the antibiotic supplements were removed and the cells maintained in antibiotic-free medium.

For the SKOV3TP5 cells, fragments of resected tumors were injected SC into mice for *in vivo* passaging. This procedure was repeated five times before cells
25 were returned to culture as described above.

Cell Culture

All reagents and media for cell culture were obtained from Life Technologies, Inc. (Gaithersburg, MD). C6 cells were cultured in Ham's F-10 supplemented with 5% FBS and 2mM L-glutamine. A375, A431 and EpH4-VEGF1

cells were cultured in DMEM supplemented with 10% FBS and 2 mM L-glutamine. SKOV3TP5 cells were cultured in McCoy's 5A medium supplemented with 10% FBS and 2mM L-glutamine. Calu-6, SF763T and SF767T cells were cultured in MEM supplemented with 10% FBS, 2 mM L-glutamine, 1 mM sodium pyruvate and 0.1 mM MEM non-essential amino acids. All cell cultures were maintained at 37 °C in a humidified atmosphere of 5-10% CO₂.

Subcutaneous Xenograft Models in Athymic Mice

Experiments were conducted in accordance with Institutional Animal Care and Use Committee (IACUC) guidelines as listed under protocol SAF029. Tumor cell lines (0.6 - 10 x 10⁶ cells/animal; n = 8-20 animals/group) were implanted SC in the hindflank region of 8-12 week old BALB/c nu/nu female mice. With the exception of experiments where the efficacy of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid on established tumors was evaluated, treatment with either 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid or vehicle commenced one day post-implantation.

For parenteral dosing, animals received a 50 µL IP bolus injection of either 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid in DMSO or DMSO alone for the indicated number of days. In most experiments, compound was administered daily. In the dosing regimen studies, compound was administered according to the schedules outlined in Table 2.

For oral administration, 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid was delivered by oral gavage (PO) at 200 mg/kg in a Labrasol®-containing vehicle.

Tumor growth was measured using venier calipers. Tumor volumes were calculated as the product of length x width x height. Statistical analysis was carried out using Student's t-test.

Results

Significant inhibition of SC tumor growth of Calu-6 (human lung carcinoma) cells in BALB/c nu/nu mice was observed following IP administration of 3-[2,4-

Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid at 75 and 100 mg/kg/day. At the conclusion of the experiment (Day 25), inhibition of tumor growth was 79 to 86% compared to vehicle-treated control animals, and mortality was 12.5% at both doses.

- 5 In subsequent experiments, 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid was administered IP to mice which had received implants of tumor xenografts representing several different tissue origins. The results of these studies are summarized in Table 1.

20 Table 1. Daily administration (except where indicated by *, dosed 3x/week) at the indicated doses (mg/kg/day) in DMSO began one day post-implantation. Percent inhibition compared to the vehicle-treated control group was calculated on the indicated days post-implantation. P values were calculated by comparing mean tumor size of the treated group to mean tumor size of the vehicle control group using the Student's t-test. ns = not significant (P > 0.05).

- 25 Including the Calu-6 data depicted in Table 1, 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid significantly inhibited the SC growth of 6 to 7 tumor cell lines tested, representing tumors of skin, brain, and lung origin. These results suggest that 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid inhibits the *in vivo* growth of multiple tumor types when administered systemically in a daily regimen.

The studies described above demonstrated that 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid was efficacious at

inhibiting the growth of several tumor types *in vivo* if drug administration began one day post-implantation. In the clinical scenario, this might simulate therapy on re-growth of tumors following tumor shrinkage by surgical resection or chemotherapy, or following metastasis of cancer.

5 To evaluate the efficacy of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid as first line therapy, that is, its effect on tumors that are already established, tumors were implanted and allowed to grow to a measurable size (approximately 100 mm³) prior to initiation of drug administration.

10 C6 cells were implanted SC into athymic mice on day zero. When measurable tumors had developed in a majority of the animals (Day 7), they were divided into 3 groups: Group 1 received daily IP administration of compound (75 mg/kg/day) from Day 7 through Day 16; Group 2 received daily IP administration of compound (75 mg/kg/day) from Day 7 through Day 22, and Group 3 received daily IP
15 administration of DMSO from Day 7 through Day 16. On Day 16, all Group 3 animals were humanely sacrificed due to tumor burden (mean tumor diameter approximately 1300 mm³), and the growth of tumors in Groups 1 and 2 was monitored until the mean tumor burden of each group reached 1300 mm³.

The results demonstrate that 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid was efficacious even when the onset
20 of administration was delayed until measurable tumors were present. Furthermore, there was a finite window of efficacy (Days 7 through 21, Group 1) that was not significantly prolonged by continued dosing beyond Day 16 (Group 2).

To assist in the development of a clinical dosing plan, dosing regimen studies
25 were conducted to determine if tumor growth could be inhibited by dosing less frequently than daily. The results are summarized in Table 2. For comparison, the results obtained with daily dosing are included.

Table 2. C6 cells were implanted SC in BALB/c nu/nu mice. Beginning one day post-implantation, animals received the indicated doses of compound, administered IP according to the schedules indicated. Control animals were dosed with vehicle (DMSO) according to the same schedules. Tumor volumes were measured and percent inhibition was calculated as described in the legend to Figure 1. n = 8 - 16 animals/group. ns = not significant (P > 0.05).

10

These data suggest that 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid can be delivered using a dosing regimen that is less frequent than daily administration. For example, doses of 50 to 75 mg/kg delivered Daily X 5 yielded efficacy similar to that seen when 100 mg/kg was administered Daily X 7. Also, a dose of 100 mg/kg was administered twice weekly or three times weekly yielded statistically significant tumor growth inhibition of approximately 40%. Thus, daily administration of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid is not necessary to achieve significant efficacy in preclinical models.

15

The efficacy of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid by the oral route of administration was examined in the C6 (rat glioma) SC xenograft model in athymic mice. Beginning one day post-

20

implantation, compound (200 mg/kg/day in solution in a Labrasol®-containing vehicle) was administered to mice PO. Tumor growth was measured using venier calipers and tumor volumes were calculated as the product of length x width x height.

- 5 In this SC xenograft model, significant inhibition of tumor growth occurred following oral treatment of mice with 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid at 200 mg/kg/day. On Day 18 post-implantation, tumor growth was inhibited by 82% compared to vehicle-treated animals, with only 10% mortality. These data demonstrate that 3-[2,4-Dimethyl-5-
10 (2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid effectively inhibited tumor growth when administered PO

EXAMPLE 2: Preformulation Studies

Preformulation studies evaluate the physico-chemical properties of the compound and enable formulation development of the compound.

The solution was filtered, appropriate dilutions made and the concentration of the compound in the supernatant was
20 analyzed by a reverse phase HPLC method. The results are tabulated in Table 3.

pH Solubility Profile

The solubility of two lots of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid was determined at pH 6.0, 6.5, 7.0, 7.5 and 8.0 of phosphate buffer and pH 9 of borate buffer. The results are indicated in Table 4 and show that the solubility increases with pH. Ionic strength of the solution and common ion effect can affect solubility.

Ionization Constant, pKa, and Partition Coefficient, Log P

3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid is a hydrophobic ionizable weak acid. The pKa is 5.02. Log P and Log D (at pH 7.4) are 3.85 and 1.5, respectively. pKa, Log P, and Log D values were determined by potentiometric titration at Robertson Microlit Laboratories, New Jersey. pKa was calculated using the Seiler method.

The preformulation studies indicated that the aqueous solubility of the compound could be enhanced about 1000 times by in situ salt formation (e.g., the sodium salt has a solubility of about 25 mg/ml in comparison to the free acid which is about 30 µg/ml). This strategy was used in the formulation development.

EXAMPLE 3: Parenteral formulations of Ionizable Substituted Indolinone**Compounds**

To be used as a parenteral formulation, and especially an intravenous formulation, a high aqueous solubility of the drug candidate is desirable. The solubility of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid was enhanced several folds by salt formation. The sodium salt of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid has a solubility of 20 mg/mL compared to the less than 0.1 mg/mL of the free acid. The solubility of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid was either enhanced by using the sodium salt of 3-[2,4-Dimethyl-5-(2-oxo-1,2-dihydro-indol-3-ylidenemethyl)-1H-pyrrol-3-yl]-propionic acid or by *in situ* salt formation using acid equivalents of sodium hydroxide during manufacture of the formulation.

Following salt formation, the formulation was buffered with various solutions, including glutamate, glycine, tris-phosphate and sodium hydroxide solutions, at pH ranging from 8-9 at different buffer strengths (0.01, 0.05, and 0.1 M). Some water miscible cosolvents like PEG-300 in varying amounts (0% to 40%) were used to enhance the solubility and to stabilize the formulation. Addition of other solubilizers, such as Polysorbate 80, was also tested.

The composition of an exemplary formulation are given in Table 6, below. The formulation if it does not contain any Cremophor® or Polysorbate-80 should be diluted 1:1 (one part formulation to 1 part IV fluid) with intravenous fluid such as sterile water for injection, containing 0.45% sodium chloride, before administration. The dilution is much higher (1:1 to 1: 50) depending on the concentration of Polyethoxylated 35 Castor Oil (Cremophor® EL) and Polysorbate-80. These parenteral formulations can also be administered orally.

Example 5 - Oral Administration-Oil Suspension

The formulation described below enhance the oral bioavailability of COMPOUND IV in beagle dogs, a preclinical absorption model. At higher doses in
20 fasted conditions, bioavailability studies in beagle dogs indicated that COMPOUND IV could have a low bioavailability due to its poor solubility.

Two oral oil suspension formulations of COMPOUND IV (50mg/gm- formulation F₃ and 250 mg/gm) were developed and evaluated in dogs for oral bioavailability. Both formulations contain 50 mg/gm of Pluronic F-68. The
25 formulation at 50 mg/gm of COMPOUND IV contains 900 mgs of sesame oil and the one that contains 250 mg/gm of COMPOUND IV contains 700 mgs of sesame oil.

Another formulation composed of as high as 750 mg/gm drug load of COMPOUND IV (formulation F₄) was developed using wet granulation. The

formulation contains 200 mgs sesame oil. An emulsion of oil in water was prepared with 50 mg/gm PLURONIC™ F68 as emulsion agent and used as granulating liquid.

5 **Example of Composition. (50 mg/gm to 750 mg/gm)**

Composition	Formulation F ₃	Formulation F ₄

Pluronic	50 mg	50 mg
Sesame Oil	900 mg	200 mg

Oil Suspension (50mg/g)	919	230

AUC refers to the area under the curve of the plasma concentration time curve and represents oral bioavailability (BA). Higher AUC indicates higher BA. The table indicates that the oil suspensions provide higher BA than a conventional wet granulated tablet.

EXAMPLE 6: Development of Preferred Formulations

The following formulation screening experiments identified preferred formulations.

4-ALKENYL (AND ALKYNYL) OXINDOLES AS INHIBITORS OF CYCLIN-DEPENDENT KINASES, IN PARTICULAR CDK2

5 Uncontrolled cell proliferation is the hallmark of cancer. Cancerous tumor cells typically have some form of damage to the genes that directly or indirectly regulate the cell-division cycle.

Cyclin-dependent kinases (CDKs) are enzymes which are critical to cell
10 cycle control. See, e.g., Coleman et al., "Chemical Inhibitors of Cyclin-dependent Kinases," *Annual Reports in Medicinal Chemistry*, vol. 32, 1997, pp. 171-179. These enzymes regulate the transitions between the different phases of the cell cycle, such as the progression from the G₁ phase to the S phase (the period of active DNA synthesis), or the progression from the G₂ phase to the M phase, in
15 which active mitosis and cell-division occurs. See, e.g., the articles on this subject appearing in *Science*, vol. 274, 6 December 1996, pp 1643-1677.

CDKs are composed of a catalytic CDK subunit and a regulatory cyclin subunit. The cyclin subunit is the key regulator of CDK activity, with each CDK
20 interacting with a specific subset of cyclins: e.g. cyclin A (CDK1, CDK 2). The different kinase/cyclin pairs regulate progression through specific stages of the cell cycle. See, e.g., Coleman, *supra*.

Aberrations in the cell cycle control system have been implicated in the
25 uncontrolled growth of cancerous cells. See, e.g., Kamb, "Cell-Cycle Regulators and Cancer," *Trends in Genetics*, vol. 11, 1995, pp. 136-140; and Coleman, *supra*. In addition, changes in the expression of or in the genes encoding CDK's or their regulators have been observed in a number of tumors. See, e.g., Webster, "The Therapeutic Potential of Targeting the Cell Cycle," *Exp. Opin. Invest. Drugs*, Vol.
30 7, pp. 865-887 (1998), and references cited therein. Thus, there is an extensive

body of literature validating the use of compounds inhibiting CDKs as anti-proliferative therapeutic agents. See, e.g. U.S. Patent No. 5,621,082 to Xiong et al; EP 0 666 270 A2; WO 97/16447; and the references cited in Coleman, *supra*, in particular reference no. 10. Thus, it is desirable to identify chemical inhibitors of
5 CDK kinase activity.

It is particularly desirable to identify small molecule compounds that may be readily synthesized and are effective in inhibiting one or more CDKs or CDK/cyclin complexes, for treating one or more types of tumors.

10 Indolinone (also known as oxindole) compounds asserted to be useful in the regulating abnormal cell proliferation through tyrosine kinase inhibition are disclosed in WO 96/40116, WO 98/07695, WO 95/01349, WO 96/32380, WO 96/22976, WO 96/16964 (tyrosine kinase inhibitors), and WO 98/50356 (2-
15 indolinone derivatives as modulators of protein kinase activity). Oxindole derivatives have also been described for various other therapeutic uses: 5,206,261 (improvement of cerebral function); WO 92/07830 (peptide antagonists); EP 580 502 A1 (antioxidants).

20 There continues to be a need for easily synthesized, small molecule compounds for the treatment of one or more types of tumors, in particular through regulation of CDKs. It is thus an object of this invention to provide such compounds and compositions containing such compounds.

25 The present invention is directed to novel 4-alkenyl- and 4-alkynyl oxindoles which inhibit cyclin-dependent kinases (CDKs), in particular CDK2. These compounds and their pharmaceutically acceptable salts, and prodrugs of said compounds, are anti-proliferative agents useful in the treatment or control of cell proliferative disorders, in particular cancer. The invention is also directed to
30 pharmaceutical compositions containing such compounds, and to the use of these compounds in the manufacture of medicaments for the treatment and/or

prevention of cancer, particularly in the treatment or control of solid tumors. The compounds of the invention are especially useful in the treatment or control of breast and colon tumors. The invention is also directed to intermediates useful in the preparation of the above anti-proliferative agents.

Compositions/Formulations

In an alternative embodiment, the present invention is directed to pharmaceutical compositions comprising at least one compound of formula I or formula II or a prodrug thereof, or a pharmaceutically acceptable salt of a
5 compound of formula I or formula II or a prodrug of such compound.

These pharmaceutical compositions can be administered orally, for example, in the form of tablets, coated tablets, dragees, hard or soft gelatin capsules, solutions, emulsions or suspensions. They can also be administered
10 rectally, for example, in the form of suppositories, or parenterally, for example, in the form of injection solutions.

The pharmaceutical compositions of the present invention comprising compounds of formula I or formula II, prodrugs of such compounds, or the salts
15 thereof, may be manufactured in a manner that is known in the art, *e.g.* by means of conventional mixing, encapsulating, dissolving, granulating, emulsifying, entrapping, dragee-making, or lyophilizing processes. These pharmaceutical preparations can be formulated with therapeutically inert, inorganic or organic carriers. Lactose, corn starch or derivatives thereof, talc, steric acid or its salts
20 can be used as such carriers for tablets, coated tablets, dragees and hard gelatin capsules. Suitable carriers for soft gelatin capsules include vegetable oils, waxes and fats. Depending on the nature of the active substance, no carriers are generally required in the case of soft gelatin capsules. Suitable carriers for the manufacture of solutions and syrups are water, polyols, saccharose, invert sugar
25 and glucose. Suitable carriers for injection are water, alcohols, polyols, glycerine, vegetable oils, phospholipids and surfactants. Suitable carriers for suppositories are natural or hardened oils, waxes, fats and semi-liquid polyols.

The pharmaceutical preparations can also contain preserving agents,
30 solubilizing agents, stabilizing agents, wetting agents, emulsifying agents, sweetening agents, coloring agents, flavoring agents, salts for varying the osmotic

pressure, buffers, coating agents or antioxidants. They can also contain other therapeutically valuable substances, including additional active ingredients other than those of formula I or II.

5 **Dosages**

As mentioned above, the compounds of the present invention are useful in the treatment or control of cell proliferative disorders, in particular oncological disorders. These compounds and formulations containing said compounds are particularly useful in the treatment or control of solid tumors, such as, for example,
10 breast and colon tumors.

A therapeutically effective amount of a compound in accordance with this invention means an amount of compound that is effective to prevent, alleviate or ameliorate symptoms of disease or prolong the survival of the subject being
15 treated. Determination of a therapeutically effective amount is within the skill in the art.

The therapeutically effective amount or dosage of a compound according to this invention can vary within wide limits and will be adjusted to the individual
20 requirements in each particular case. In general, in the case of oral or parenteral administration to adult humans weighing approximately 70 Kg, a daily dosage of about 10 mg to about 10,000 mg, preferably from about 200 mg to about 1,000 mg, should be appropriate, although the upper limit may be exceeded when indicated. The daily dosage can be administered as a single dose or in divided
25 doses, or for parenteral administration, it may be given as continuous infusion.

Examples

The compounds of the present invention may be synthesized according to known techniques, such as for example the general scheme provided above. The
30 following examples illustrate preferred methods for synthesizing the compounds and formulations of the present invention.

Example 1: General Synthesis Steps and Starting Materials**Method A: Preparation of 1-alkyl-2-propyn-1-ols via Grignard addition to aldehydes**

A solution of the appropriate aldehyde (4.0 mmol) in 30 mL dry tetrahydrofuran, under argon, was cooled to 0 °C with an ice bath.

Ethynylmagnesium chloride (5 mmol, 0.5 M solution in THF) was added dropwise, and the solution was stirred at 0 °C or room temperature for 1 to 3 h. The reaction was quenched by the addition of a saturated ammonium chloride solution in water (15 mL), and the tetrahydrofuran was evaporated *in vacuo*. The residue was then extracted with ethyl acetate (3x30 mL), and the combined organic extracts were dried over magnesium sulfate, and concentrated *in vacuo* to yield the desired

propargyl alcohol which was used in the coupling reaction without further purification.

Method B: Preparation of 1-alkyl-2-propyn-1-ols via Grignard addition to aldehydes

A solution of the appropriate aldehyde (4.0 mmol) in 30 mL dry tetrahydrofuran, under argon, was cooled to 0 °C with an ice bath.

Ethynylmagnesium chloride (10 mmol, 0.5 M solution in THF) was added dropwise, and the solution was stirred at 0 °C or room temperature for 1 to 3 h.

The reaction was quenched by the addition of a saturated ammonium chloride solution in water (15 mL), and the tetrahydrofuran was evaporated *in vacuo*. The residue was then extracted with ethyl acetate (3x30 mL), and the combined organic extracts were dried over magnesium sulfate, and concentrated *in vacuo* to yield the desired propargyl alcohol which was used in the coupling reaction without further purification.

Method C: Preparation of 4-alkynyloxindoles via Palladium(0)-mediated coupling

5 (where X=I)

A solution of the appropriate 4-iodooxindole (4 mmol), and the appropriate alkyne (4.4 mmol) in 3 mL dimethylformamide and 3 mL triethylamine was degassed by bubbling argon through the solution for 15 minutes. At this time
10 copper (I) iodide (16 mg, 0.1 mmol) and palladium catalyst (0.04 mmol) were added, and the reaction was heated, under argon, at between 60 to 90 °C for 6 to 96 hours. After cooling, water (20 mL) was added and the precipitate was filtered off and dried. The product was purified via either flash column chromatography (SiO₂, 230-400 mesh with ethyl acetate/hexanes as solvent) or with reverse phase
15 HPLC (using ether acetonitrile / water or acetonitrile / water / trifluoroacetic acid as solvent).

Method D: Preparation of 4-alkynyloxindoles via Palladium(0)-mediated coupling

A solution of the appropriate 4-bromooxindole (4 mmol), and the appropriate alkyne (4.4 mmol) in 3 mL dimethylformamide and 3 mL triethylamine was degassed by bubbling argon through the solution for 15 minutes. At this time copper (I) iodide (16 mg, 0.1 mmol) and palladium catalyst (0.04 mmol) were
 5 added, and the reaction was heated, under argon, at between 60 to 90 °C for 6 to 96 hours. After cooling, water (20 mL) was added and the precipitate was filtered off and dried. The product was purified via either flash column chromatography (SiO₂, 230-400 mesh with ethyl acetate/hexanes as solvent) or with reverse phase HPLC (using ether acetonitrile / water or acetonitrile / water / trifluoroacetic acid as
 10 solvent).

Method E: Preparation of methyl esters from carboxylic acids

To a solution of the appropriate carboxylic acid (15.3 mmol) in diethyl ether
 15 (30 mL) was added a solution of diazomethane (20 mmol, 0.47 M in ether). The reaction was stirred at room temperature for 1 hour at which time a few drops of acetic acid were added. The solution was washed with saturated sodium bicarbonate (3x25 mL) and the solvent was evaporated to yield the desired methyl ester which was used without further purification.

The appropriate methyl ester (0.14 mmol) was dissolved in a mixture of 2
 25 mL tetrahydrofuran and 2 mL water. Lithium hydroxide (2.8 mmol, 20 equiv.) was added, and the reaction was stirred at room temperature for 1 to 24 hours. The tetrahydrofuran was evaporated and 10 mL water was added. The aqueous layer was extracted with ethyl acetate (2x10 mL) and the aqueous layer was then acidified to pH = 2 with 1 N hydrochloric acid. The aqueous layer was extracted
 30 with ethyl acetate (4x20 mL), and the combined organic extracts were washed with a saturated solution of sodium chloride and were then dried over magnesium

The reaction was stirred at room temperature for 30 minutes, and ammonia gas was then bubbled through the reaction mixture for 5 minutes or the appropriate amine was added. The reaction was then stirred at room temperature for 20 minutes to 24 hours, and was then quenched by the addition of water (10 mL). The tetrahydrofuran was then evaporated and the aqueous layer was extracted with ethyl acetate (3x30 mL) to yield the carboxamide as a white crystalline solid which was coupled without further purification.

CDK2 FlashPlate Assay

5

To determine inhibition of CDK2 activity, purified recombinant retinoblastoma (Rb) protein was coated on 96 well FlashPlates (New England Nuclear, Boston, MA). Rb is a natural substrate for phosphorylation by CDK2 (Herwig and Strauss *Eurr. J. Biochem.*, Vol. 246 (1997) pp. 581-601 and
 10 references therein). Recombinant active human Cyclin E/CDK2 complexes were partially purified from extracts of insect cells. The active Cyclin E/CDK2 was added to the Rb-coated FlashPlates along with ³³P-ATP and dilutions of test compounds. Plates were incubated for 25 minutes at room temperature with shaking, then washed and counted in the Topcount scintillation counter (Packard
 15 Instrument Co., Downers Grove, IL). Dilutions of test compounds were tested in duplicate in each assay. The percent inhibition of Rb phosphorylation, which is a measure of the inhibition of CDK2 activity, was determined according to the following formula:

$$20 \quad 100 \times \left[\frac{\text{total} - \text{nonspecific}}{\text{total} - \text{nonspecific s}} \right]$$

where "test compound" refers to the average counts per minute of the test
 duplicates, "nonspecific" refers to the average counts per minute when no Cyclin
 E/CDK2 was added, and "total" refers to the average counts per minute when no
 25 compound was added.

The results of the foregoing *in vitro* experiments are set forth in Tables I A

Cell-Based Assays

5

The estrogen receptor negative epithelial breast carcinoma line (MDA-MB-435) was purchased from American Type Cell Culture Collection (ATCC; Rockville, MD) and was grown in the medium recommended by ATCC. For analysis of the effect of the test compounds on growth of these cells, the cells

were plated at 2000 cells per well in a 96-well tissue culture plate, and were incubated overnight at 37°C with 5% CO₂. The next day, the test compounds were dissolved in 100% dimethyl sulfoxide (DMSO) to yield a 10 mM stock solution. Each compound was diluted with sterile medium to 1 mM in a sufficient quantity to yield a final concentration of 120 µM. The compounds were then serially diluted in medium with 1.2% DMSO. One-fourth final volume of the diluted compounds was transferred to 96 well plates. Test compounds were assayed in duplicate. DMSO was added to a row of "control cells" such that the final concentration of DMSO in each well was 0.3%. Wells to which no cells were added served as the "blank." Wells to which no inhibitor was added served as "no inhibitor control". The plates were returned to the incubator, and 5 days post addition of test compound, were analyzed as described below.

3-(4,5-Dimethylthiazole-2-yl)-2,5-diphenyl-2H-tetrazolium bromide (thiazolyl blue; MTT) was added to each well to yield a final concentration of 1 mg/mL. The plates were then incubated at 37°C for 3 hours. The plates were centrifuged at 1000 rpm for 5 minutes prior to aspiration of the MTT-containing medium. The MTT-containing medium was then removed and 100 µL 100% ethanol was added to each well to dissolve the resulting formazan metabolite. To ensure complete dissolution, plates were shaken for 15 minutes at room temperature. Absorbencies were read in a microtiter plate reader (Molecular Dynamics) at a wavelength of 570 nm with a 650 nm reference. Percent inhibition was calculated by subtracting the absorbance of the blank (no cell) wells from all wells, then subtracting the division of the average absorbance of each test duplicate by the average of the controls from 1.00. Inhibitory concentrations (IC₅₀) were determined from the linear regression of a plot of the logarithm of the concentration versus the percent inhibition.

The colon carcinoma line SW480 also was obtained from the ATCC and was tested according to the same protocol provided above with the following

modification: cell line SW480 was plated at 1000 cells per well and analyzed at 4 days post addition of test compound.

The results of the foregoing *in vitro* tests are set forth below in Tables II and
